WORKSHOP

As a cross-disciplinary educational opportunity, the workshop will blend software, hardware, modern fabrication tools and artistic narrative to create a final integrated piece of electronic art—displayed on the final night of the workshop.

During the first two weeks of the workshop, the focus will be on studying related work within the fabrication and projection spaces, while also providing hands-on instruction for both fabricating an object and projection-mapping that object. Each student will work with the instructors to create a story around their object or physical space that will then be told and augmented with a projection or digital layer.
